

## CLINICAL GUIDELINE

# Omalizumab in Chronic Spontaneous Urticaria

A guideline is intended to assist healthcare professionals in the choice of disease-specific treatments.

Clinical judgement should be exercised on the applicability of any guideline, influenced by individual patient characteristics. Clinicians should be mindful of the potential for harmful polypharmacy and increased susceptibility to adverse drug reactions in patients with multiple morbidities or frailty.

If, after discussion with the patient or carer, there are good reasons for not following a guideline, it is good practice to record these and communicate them to others involved in the care of the patient.

<b>Version Number:</b>	2
<b>Does this version include changes to clinical advice:</b>	Yes
<b>Date Approved:</b>	15 <sup>th</sup> May 2019
<b>Date of Next Review:</b>	30 <sup>th</sup> April 2022

# Protocol for Omalizumab for Chronic Spontaneous Urticaria

## Indications:

- Patient over 12 years of age
- UAS7 score of 28 or more
- No response to standard treatment with H1 antihistamines (up to 4x licensed dose) and/or leukotriene receptor antagonists and/or H2 antihistamines.

Patient seen by doctor. If criteria met then:

- Information on Omalizumab given
- UAS7 and DLQI leaflets given to be completed at each visit
- Book appointment for first dose
- Omalizumab 300mg given 4 weekly  
(can be given unlicensed at different frequencies and doses )

After 4<sup>th</sup> dose (week 16) UAS7 checked(week 20)

If UAS7  $\leq$  16  
**Continue Omalizumab**

If UAS7 > 16 **Non-responder**  
**Discuss with consultant**

After 6<sup>th</sup> dose (week 24)

If patient in remission  
(UAS7 < 6)  
- **STOP OMALIZUMAB**  
-Telephone consultation  
with Nurses at 6-8 weeks  
- Appointment for clinic 3  
months.

If not in remission or  
condition relapses  
(UAS7 > 16)  
**discuss with Consultant**  
A further course of  
omalizumab may be  
indicated

## **NHS GGC Omalizumab Protocol for Chronic Spontaneous Urticaria**

### **1. Omalizumab Indication:**

Omalizumab is a recombinant DNA-derived humanised monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed as an 'add on therapy for the treatment' of chronic spontaneous urticaria (CSU) in adult and adolescents (12 years and over) with inadequate response to H1 antihistamine treatment.

Evidence for omalizumab use in CSU comes from the randomized, double-blind, placebo controlled phase III studies; GLACIAL<sup>1</sup>, ASTERIA I<sup>2</sup> and ASTERIA II<sup>3</sup>. The ASTERIA studies reported significant improved outcomes for itch severity score (ISS). In the GLACIAL study of 336 patients with CSU or chronic idiopathic urticaria who remained symptomatic despite H1 antihistamines (up to 4x licensed dose) plus H2 antihistamines or leucotriene receptor antagonist (LTRA) or both for at least 3 consecutive days before screening, significant improvements in both urticaria activity score over 7 days (UAS7 score) and weekly ISS were demonstrated.

### **Scottish Medicines Consortium (SMC) Advice:**

Following SMC review, omalizumab has been accepted for restricted use in Scotland as add on therapy for the treatment of CSU in adults and adolescent patients with an inadequate response to combination therapy with H1 antihistamine treatment, LRTA and H2 antihistamines used according to current treatment guidelines<sup>4</sup>.

For NHS GGC the decision to initiate omalizumab therapy for CSU is restricted to a Consultant or Associate Specialist Dermatologist in accordance with the SMC restriction - Appendix: Protocol for omalizumab for chronic spontaneous urticaria.

## **2. Patient Assessment prior to starting omalizumab**

- Patients will be given an appointment at a dermatology clinic for initial assessment (week 0).
- The number of wheals and the severity of itch much be assessed by completing weekly Urticarial Activity Scores (UAS7) and Dermatology Life Quality Index (DLQI) over at least 4 weeks before considering omalizumab.
- Patients with a UAS7 score  $\geq 28$  with an inadequate response to combination therapy with H1-antihistamines (up to 4 times licensed dose) and/or LTRA and/or H2-antihistamines are eligible for omalizumab.
- Patient to be given omalizumab information leaflet.
- Patients who meet criteria for starting omalizumab will require a medicine prescription chart (Kardex<sup>®</sup>) to be completed by a doctor/Nurse prescriber. Nursing staff in charge should be notified in advance of any new patients to allow time to order the first dose of medication. The patient should be booked to attend the Nurse-led outpatient clinic to receive treatment. The Kardex<sup>®</sup> should then be placed in a designated folder.

## **Drug Preparation**

Pre-filled syringe of 1ml omalizumab 150mg

## **Dosage and Administration**

Patient attendance at nurse-led clinic (week 1):

- Patient identification should be confirmed
- 300 mg of omalizumab (i.e. 2 syringes) to be administered by subcutaneous injection into deltoid area of arm, alternatively the thigh can be used.
- DO NOT give omalizumab by intravenous or intramuscular injection
- Omalizumab should only be given where full resuscitation equipment is available due to the anaphylactic risk. Most reactions are reported within the first 2 hours after injection.

- Subsequent dose to be ordered and prescribed at each visit (weeks 4, 8, 12 & 16).

### **3. Patient monitoring whilst receiving Omalizumab**

No routine blood tests are necessary.

Blood pressure, pulse and oxygen saturation should be monitored pre and post injection.

For the first injection, the patient should remain in department for 2 hours for observation. For subsequent injections, patient should remain in department for 30 minutes for observation. Patients require first three (3) doses of Omalizumab be given in hospital. From fourth (4th) dose onwards some patients may be appropriate to self inject. The decision which patients are suitable for self- injection is made by the doctor along with the patient.

### **Side effects of treatment**

The treatment is usually very well tolerated and has relatively few side effects. There can be a small reaction at the site of injection (itch, pain, redness or swelling) shortly after it is given. Anaphylaxis has been reported in Asthma patients receiving Omalizumab.

Headaches, sore throat, 'flu like symptoms', arthralgia, sinusitis. Fever and abdominal pain have been reported in children.

### **Contraindications**

- Omalizumab should not be given to patients with known hypersensitivity to active ingredients or any excipients. Anaphylaxis due to the treatment would usually contraindicate further injections.
- Omalizumab should not be given during breastfeeding or pregnancy.  
(Avoided unless necessary after careful consideration of its benefits in relation to any known/unknown risks, although there is currently no evidence that it is harmful to a baby)

### **Interaction with other medications**

There are no known interactions with other medications. Medications such as steroids and other immunosuppressives which are used for urticaria should normally be possible to stop.

**Antihistamines should be continued throughout course of treatment.**

### **4. Monitoring of Omalizumab Treatment Response**

All patients receiving omalizumab should be recorded on a drug-disease register.

After the 4<sup>th</sup> injection of omalizumab (week 16), the patient will be reviewed by a specialist nurse or at Consultant clinic to assess response to treatment using UAS7 and DLQI score.

Treatment will be discontinued after 4th injection for non responders (UAS7 >16).

In exceptional cases it may be appropriate to continue Omalizumab in patients:

- with a UAS7 16-27 if the baseline score was in excess of 40
- Who are steroid or immunosuppressive-dependent and unable to stop their treatment without severe symptom relapse and should be changed to omalizumab to minimize long term risks of therapy
- with a large angio- oedema component since this is not recorded on UAS7<sup>5</sup>

Patients demonstrating improvement of at least 50% in UAS7 and DLQI score for CSU will continue for a further 2 months of treatment (weeks 20 & 24), therefore completing a full 6 month course of omalizumab.

### **Treatment relapse**

UAS7 scores should be carried out monthly after completing a full course of omalizumab to assess if symptoms have relapsed despite taking antihistamines. A decision to start another 6 month course of omalizumab will be based upon a qualifying UAS7 score as described in section 2. .

## Communication

Please inform the patient's GP that this medicine is being prescribed by Acute and, where relevant, supplied to the patient via a hospital prescription for community pharmacy dispensing. Within General Practice it is beneficial for patient and prescriber safety to ensure that a patient's medicine record includes medicines that may be prescribed and supplied outwith the GP practice.
